

CSE 1325-004 Homework #1

Hello World and Some More

For this homework assignment, you will be writing a “Hello World” Program, but with some extra lines of output, asking for user input, and performing arithmetic operations on ints and doubles.

First, you must set up your Ubuntu environment (see class slides).

Second, you must write a program, called “abc1234_Hello_World_1.cpp” (replace abc1234 with your netid) that does the following:

- Say “Hello User” to the user when the program is created
- Ask the user for their name
- Take their name as input
- Thank the user by name for telling you their name
- Ask for two numbers (ints)
- Show the Sum of these two numbers as an int
- Show the Difference of these two numbers as an int (Num1 – Num 2)
- Show the Product of these two numbers as an int
- Show the Quotient of these two numbers as an int (Num 1 / Num 2)
- Ask for two more numbers (doubles)
- Show the Sum of these two numbers as a double
- Show the Difference of these two numbers as a double (Num1 – Num 2)
- Show the Product of these two numbers as a double
- Show the Quotient of these two numbers as a double (Num 1 / Num 2)
- Thank the user “by name” for their time

Bonus (10 pts)

Create a second file called “abc1234_Hello_World_2.cpp”. This will do the exact same thing as above, but with one main difference. You will not ask for the user’s name. Instead, you must figure out the user’s name by some other means. It is acceptable to be a user name, proper name, or some other identifying name for that person. The name cannot be hard-coded in the source file. Test your program in two different user accounts (create a 2nd account on your Ubuntu copy with different profile information) and see if it works.

Deliverables

You will submit your code and screen shots of your code working via Blackboard. You will upload a ZIP file, named “abc1234_HW1.zip”, containing 2 files (5 if you did bonus):

- abc1234_Hello_World_1.cpp (source code)
- abc1234_Hello_World_1.png (screen shot of program running)
- abc1234_Hello_World_2.cpp (source code)
- abc1234_Hello_World_2a.png (screen shot of program running with first user)
- abc1234_Hello_World_2b.png (screen shot of program running with second user)

Full credit files named incorrectly result in a loss of 5 points each. Bonus files named incorrectly will result in a loss of 1 bonus point each.

For information on taking screen shots and creating zip files in Ubuntu, see the class resources section in Blackboard.
